Title: Spencer Gifts takes credit a step farther (retail technology)

Journal: Chain Store Age Executive vol.63, no.2 p.57

Publication Date: Feb. 1987 Country of Publication: USA

CODEN: COMLEF ISSN: 0193-1199

Language: English Document Type: Journal Paper (JP)

Treatment: General, Review (G); Practical (P)

Abstract: Spencer Gifts, the Pleasantville, NJ-based retailer, has taken the first step into the future of credit authorization by subscribing to Telecard, a credit authorization service of Telenet. While the chain is currently an authorization-only subscriber, it is only a matter of time before electronic data capture is added to Spencer's transaction processing. The system is installed in 167 locations which utilize Micro-Fone II credit authorization terminals accessing the Telenet data network. The network forwards the consumer account and purchasing information to either Telenet's host computer, a Tandem TXP system, or an intermediary service. These, in turn, forward the information to the appropriate authorization data base. If the transaction is authorized, an approval code is transmitted back over the same network to the Micro-Fone terminal. (0 Refs)

Digital pad collects autographs

AUGMENTED TITLE: from Interlink Electronics Inc.

IEEE Spectrum v. 36 no6 (June 1999) p. 102-3

DOCUMENT TYPE: Product Evaluation ISSN: 0018-9235 LANGUAGE: English

RECORD STATUS: Corrected or revised record

ABSTRACT: Interlink Electronics has introduced the ePad, a pen-like input device that captures handwritten signatures for PC applications such as signing electronic documents and authorizing online banking transactions. The pressure-sensitive pad, which is backed by Interlink's VP9000 software and connects to a computer via a standard RS-232 port, sells for \$69.95 and is also available without software in packs of 24.

Handspring's Handspring Visor Deluxe, Novatel's Minstrel S, Extech's MST-IV, and VeriTop VeriTop Mobile Terminal and VeriTop Virtual Gateway are devices chosen for client CapitalVenue by VeriTop, a mobile wireless credit authorization provider. CapitalVenue sought an automated way to record the **credit card** information of walk-in registrants at its conferences. Attendees of half-day sessions had to be registered quickly before the start of the conferences, which created a traffic jam at the registration table. The new, automated system uses **personal digital assistant (PDA)**-based wireless credit authorization via wireless modems, mag-stripe card readers, and Internet connectivity software. With the wireless solution, no phone lines or power sources had to be supplied at registration tables. In addition, 23 **credit card transactions** were **authorized** and processed easily and in real time, and no delayed data entry was required.

ProPay's ProPay.com, an online, Web-accessible person-to-person e-commerce payment system, aims to allow any two people to exchange funds from any location at any time of day or night. ProPay would allow any participant to fill out a set of documents and obtain **approval** online to receive **credit card payments**. People will be able to transfer money between **personal digital assistants (PDAs)**, and wireless transmission support will eventually be augmented with other applications, including online auctions.

" Customers initiate the process by signing up for credit approval on ProPay's Web site, just as merchants do. When approved, buyers from online auction sites pay ProPay via **credit card**, but their **credit card** information is not given to the seller. ProPay guarantees payment to sellers within two days. ProPay's fee is 35 cents plus 3.5 percent of the transaction, and it also holds the money for two days, earning interest on it during that time period. According to analysts and Brad Wilkes, founder and CEO of ProPay, this fee is appropriate for a secure, global, personal electronic payment system. ProPay has completed two rounds of venture funding and plans an IPO. ProPay.com's activities rely on a proprietary online account underwriting and risk-assessment system. The system identifies the person requesting an account, authenticates the **credit card numbers**, and evaluates the requesters credit rating.

Abstract: The current macro-payment systems used by most e-commerce sites are not suitable for high-volume, low-cost produce or service purposes, such as charging per page for Web site browsing. These payment technologies suffer from the use of heavyweight encryption technologies and reliance on always-online **authorisation** servers. Micro- **payment** systems offer an alternative strategy of pay-as-you-go charging, even for very low-cost, very high-volume charging. However, several different micro-payment schemes exist, not all of which are suitable for all e-commerce uses. We compare and contrast several micro-payment models and outline a new micro-payment technology which we have been developing. (15 Refs)

Journal Announcement: 0303W4

Abstract: Signcryption is a new cryptographic primitive which simultaneously fulfills both the functions of digital signature and public key encryption in a logically single step, and with a cost significantly lower than that required by "signature followed by encryption". It has many applications in such areas as electronic cash payment systems, secure and authenticated key establishment, secure multi-casting over the Internet, authenticated key recovery, etc.. In secure and authenticated group communication there is a need for threshold generation of signcryption. In this paper, we propose a protocol for threshold generation of signcryption using the techniques of verifiable secret sharing (VSS) and secure multi-party computation (MPC). In the protocol, any t or more honest members can efficiently generate valid signcryption text of a given message, while the adversary who corrupts up to $t - 1$ group members cannot forge any valid signcryption text. The protocol of computing reciprocals of secrets presented by R. Gennaro, S. Jarecki, H. Krawczyk, and T. Rabin is also modified so that the efficiency is improved. 14 Refs.

Journal Announcement: 0204W4

Abstract: Electronic payment systems are well-understood to be an essential step on the road to electronic commerce, and are thus in high demand. There has been a strong effort in developing secure untraceable off-line electronic cash protocols since Chaum proposed the first e-cash system in 1991 and some systems are now in use. However, there are still many open problems in the field of e-payment system research. The basic problems with all electronic payment systems for issuers of e-cash are to prevent double spending and to prevent kidnap and laundering. For the using of credit card in transaction is very popular, it is proper to design e-payment system based on smart card. There are many researchers making great efforts to do this work and gain some useful results. An efficient fair payment system by electronic wallet is presented. Users in the system have only one personal account in the bank. In the withdrawal protocol, the user gives a correctly constructed message for possibly coin tracing to the bank and gets a blind signature on his identity from the bank. In the payment protocol, with the help of tamper-resistance card, the user proves to the shop that he spends a valid e-cash and sends a correctly constructed message for possibly owner tracing to the shop. A valid e-cash can be deposited to the bank by the shop. If a user spends an e-cash more than one times, with the help of the Trustee, the bank can find the user

Abstract (Basic): US 20030191700 A1

NOVELTY - A time record generated using the recorded clock-in and clock-out time of an employee, after receiving the **identification** data, is transmitted to a host server (220) through a communication network (240).

USE - For recording employee time records in point of sales terminal such as cash registers, electronic **payment authorization** devices for use with **credit cards**, debit cards, smart cards, and **personal digital assistants (PDAs)**, cellular telephones, personal computers, smart card devices, telephones with interactive voice response system, media device with communication port such as telephone modem, cable modem, digital subscriber line (DSL) modem, devices with embedded software operating systems, electronic purse applications, license issuance devices, customer loyalty applications, etc, and in businesses such as in retail shops, hospitals, oil and gas businesses, government agencies, etc.

ADVANTAGE - Enables to collect, reconcile and process labor resource data at a business location through an electronic transaction device.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the labor source data recording system.

JP 2003281453 A 11 G06F-017/60

Abstract (Basic): JP 2003281453 A

NOVELTY - A non-contact integrated circuit (IC) card reader/writer (3) connected to a personal digital assistant (PDA) (1) or personal computer (2), writes payment information and number of purchased product in a non-contact IC card (4). The product is delivered to the user, after verifying payment information stored in the card and the host (5).

USE - For online shopping.

ADVANTAGE - Prevents forgery by verifying payment information and number of purchased product stored in non-contact integrated circuit card and host, during delivery of the purchased product.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the goods receipt system. (Drawing includes non- English language text).

CIP of application US 99334815
CIP of application US 99335327

Abstract (Basic): US 6601040 B1

NOVELTY - A controller provides interface between vending machine and portable communication device, based on input user **identification (ID)**. A storage unit stores incentive-based advertisement term which is delivered to user based on term selected by user. An error condition is output based on non-usage time of the terminal and reauthorization of user, is performed to reprocess **transaction data**, if **authorization limit** exceeds preset level.

USE - Electronic commerce terminal communicates with portable communication device e.g. **personal digital assistant (PDA)**, pager, **cellular phone**, and personal computer for communicating and transacting with vending machine e.g. copier, printer, facsimile, laptop/palmtop printer, data ports, notebook computer, microfiche device, projector, scanner, camera, modem in business center, hotel through Internet, telecommunication line e.g. international digital standard network (ISDN), asynchronous digital subscriber line (ADSL), very small aperture terminal (VSAT) satellite.

ADVANTAGE - Enables accessing and synchronizing portable and fixed data resource, network resource e.g. Internet resource and file contents while transacting business in public place.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining the business transaction process.

Abstract (Basic): US 20030083945 A1

NOVELTY - Transaction-related information including an account identifier is received, accessed and verified with the account. An approval signal is generated upon satisfactory verification and a communication device associated with the account is contacted. Transaction confirmation is requested from the device. Commercial **transaction is authorized** on receiving the **approval** signal and the **transaction** confirmation.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) transaction system; and
- (2) communication device.

USE - For **authorizing** commercial **transaction** with respect to user using debit card, **credit card**, or communication device (claimed) such as mobile phone, **personal digital assistant** (PDA), two-way pager, for purchasing items in department store, shop, restaurant.

ADVANTAGE - Security of commercial **transaction** **authorization** is increased, since **transaction** system **authorizes** the **transaction** only after confirmation.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining commercial **transaction** **authorization** method.

Abstract (Basic): KR 2003019277 A

NOVELTY - A system for distributing and managing an oil by an oil purchase exclusive card is provided to secure a transparency of an oil transaction by constructing an oil distributing and managing system through an oil purchase exclusive card and a wireless/wire PDA terminal for payment of the oil purchase exclusive card.

DETAILED DESCRIPTION - If a payment is executed through an oil purchase exclusive card(10), a PDA payment terminal(20) receives a seller input information with respect to an oil supply and issues an oil sale bill. A financial payment server(40) approves a cost with respect to an oil purchase and integrates issuing details of the oil purchase exclusive card(10). A customs server(70) recognizes importation details of oil. A taxation business server(80) receives and

manages payment details and **credit card** transaction details between a seller and a purchaser from the financial payment server(40). A managing system(60) receives importation details and entry details of an oil, receives issuing details of the oil purchase exclusive card(10) and payment details by the oil purchase exclusive card(10), receives payment information inputted through the **PDA** payment terminal(20), monitors an oil distribution condition in a real time, and performs an integrated analysis. A monitoring server(100) receives an oil distribution condition and an analysis result from the managing system(60), and monitors an oil distribution condition in real time. A web service server(90) makes the oil distribution condition and the analysis result. A mobile communication server(30) is connected to the financial payment server(40), the web service server(90), and the managing system(60) through the **PDA** payment terminal(20) by wireless and executes a wireless relay for requesting a payment or searching various kinds of information.

Abstract (Basic): US 20030078895 A1

NOVELTY - An auto-attendant (3) including a processor (31) and communication module (32), performs two-way communication with the user's **cellular phone** (4) to receive requests for electronic payment for goods/services. The auto-attendant **verifies** the user's mode of **payment** and provides an **authorization** code to the user. A processor (21) in the vending machine (2), receives the authorization from the user and provides goods/services.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) method of making payments for vending machine purchases;
- (2) method of confirming payment by auto- attendant;

(3) auto-attendant; and

(4) method of providing goods/services by vending machine.

USE - For making payments for vending machine purchases such as confections or services such as parking time, through cellular telephone.

ADVANTAGE - A purchase is authenticated with no direct intervention between the auto-attendant and the vending machine, as the **cellular phone** acts as an intermediary. Hence payment is securely authenticated and payment may be made through **cellular phone**, **credit card** or line of credit.

DESCRIPTION OF DRAWING(S) - The figure shows the schematic view of pay-by-phone system.

---------------	---	--	---	-------------	--

Abstract (Basic): KR 2003006327 A

NOVELTY - A parking fee settlement system and method are provided to simply settle parking fees by using a **credit card** or an electronic money.

DETAILED DESCRIPTION - The system comprises a payment device(10), a server(12) and a parking fee settlement device(14). The payment device(10) stores personal **credit card** data and performs a payment function. The personal **credit card** data includes a card **number**, a card issue date and a card expiration date. The payment device(10) can be a magnetic card, an IC card, a mobile phone or a **PDA**. The parking fee settlement device(14) receives the **credit card** data from a customer who owns the payment device(10), and transmits the **credit card** data and a car entrance time to the server(12). The device(14) includes a credit data reader which can read the credit data from the magnetic card or the IC card, or a module which can receive the credit data from the mobile phone or the **PDA** over a wireless LAN(Local Area Network). The device(14) transmits the **credit card** data to the

server(12), receives data on a discount of a parking fee and settles the final parking fee when the customer exits a parking place. The server(12) stores the personal **credit card** data and the car entrance time transmitted by the device(14) at a database, and also data on a discount of a parking fee determined according to a goods purchase amount. The server(12) transmits a **credit card payment approval** request to a **payment server**.

US 20020194135	A1	6	G06F-017/60	

Abstract (Basic): US 20020194135 A1

NOVELTY - A memory management unit (120) assigns a protected region within a memory (130) to payment and non-payment applications being executed by a processor. The payment and non-payment applications provide payment and non-payment related e-services over a secured financial network and an open network.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Service provision method; and
- (2) **Credit card** verification provision system.

USE - Multi-application terminal e.g. POS terminal, kiosk, payment device, peripheral device i.e. publicly accessible device using private hand-held or **portable device** such as **cell phone**, beeper, two-way radio, smart phone, communicator, **personal digital assistant (PDA)** in e-payment or retail environment. Using network such as telephone network wireless, local area network (LAN), wide area network (WAN), intranet, world wide web (internet) and wired cable transmission system. For processing electronics **payment i.e. credit card authorization**, check authorization, etc., to support ~~e-services e.g. e-reservation~~ service for restaurant, purchase tickets for concert, sporting event, movies.

ADVANTAGE - Enables the developers or merchants to perform partial downloads of the new application or required functions, rather than a large, monolith piece of code, thereby saving amount of time and money an minimizing inconvenience to the merchant's customers. Since individual application can remain physically separate and not be linked into a single piece of code, no additional certifications are required for an existing application, when adding or changing payment-related or non-payment application. Utilizes hardware/software application separation mechanism that permits applications to safely exist side-by-side without corrupting one another.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of the multi-application terminal within e-payment environment.

Abstract (Basic): KR 2002091015 A

NOVELTY - A system and a method for the business management/electronic payment by using a **PDA (Personal Digital Assistant)** are provided to make the participants of a transaction easily use a business management/electronic payment service by employing the **PDA** in a CDMA(Code Division Multiple Access)-2000 communication network.

DETAILED DESCRIPTION - The **PDA** (100) has an electronic payment program and a mobile business management program. A request for the electronic **payment** and a result of an **approval** are displayed on the **PDA**. The request for the real time article information and the result of the request are displayed on the **PDA**. An enterprise server(400) connected to a **PDA** gateway server(300) receives the payment information, accepts the request for the information about the orders/stockpile/customers/articles, and transmits the result of the request. An electronic payment server(500) transmits the payment request information to a VAN server(600) and the approval information of the VAN server to the **PDA** gateway server. An encryption/decryption and authentication server(700) encodes or decodes the information about the payment and the business management. A **credit card** company server(800) and a bank sever(900) transmit the result of the approval to the VAN server.

Abstract (Basic): US 20030004827 A1

NOVELTY - The use of a merchant card at a central processing area is detected. A phone **number** or a **pin number** to cause a call to be placed to a ~~cellular phone of a user to~~ **authorize the charge card transaction**, is utilized based on detection result. A report of the user **charge card** transaction is transmitted to the **cellular phone** and **approval** of the **transaction** to a merchant's **charge card** terminal is authorized.

USE - For permitting user to conductor charged card transaction using ATM, point of sale system, etc.

ADVANTAGE - The confidentiality of the user **identification** data and user private key are enhanced, thus integrity of **transaction approval** process is improved.

Abstract (Basic): WO 200286829 A1

NOVELTY - The purchase details comprising purchase value and consumer details are forwarded to a processor (8) for verification. The verified purchase details are transferred to the financial institution (5) where the customer has an account for **authorization of transaction**. The funds are transferred from the customer's account to the merchant's financial institution (7) based on authorization.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for goods transaction facilitating system.

USE - For performing transaction between the consumer and the merchant for e-commerce applications using mobile phone, **PDA**, in Internet business environment.

ADVANTAGE - Reduces the necessity for confidential information to be forwarded to the institution and the merchant during payment.

Reduces the risk of misuse of the **credit cards**.

Abstract (Basic): US 20020123967 A1

NOVELTY - A share secret is searched from a share secret table in a **portable electronic authorization device (PEAD)** (200). Received digital data representing a secure message, is decrypted, if the share secret is found otherwise a share secret is computed in the **PEAD**.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

(1) Internet-based secure message transmission method; and

(2) Internet-based secure message exchanging method.

USE - For receiving a secure message pertaining to an electronic transaction conducted over Internet.

ADVANTAGE - Allows **transaction approvals** to occur within the **portable electronic authorization device (PEAD)**, hence enhances the confidentiality of the user **identification** data and the user's private key and enhances the integrity of the transaction process.

DESCRIPTION OF DRAWING(S) - The figure shows a **portable electronic authorization device**.

Abstract (Basic): US 20020128980 A1

NOVELTY - A communication link is established between a consumer terminal (202) and a provider's terminal (212) through a network (204), and a transaction is established by entering the related information. An information and a signal corresponding to an unique **ID** trait (UIT) such as fingerprint, retina pattern, iris pattern of the consumer are transmitted to the provider's terminal from the consumer terminal while establishing transaction.

DETAILED DESCRIPTION - An **INDEPENDENT CLAIM** is included for communication device.

USE - For business transaction such as electronic banking, stock trading, goods purchasing, service provision through Internet using communication device, such as wireless device e.g. **PDA**, **cellphone**, satellite broadcasting set-top box, portable computer with a wireless modem, wired device e.g. point-of-sale terminal, PC server, ATM machine, cable set-top box or land-line telephone.

ADVANTAGE - Secure **transaction** is conducted by **verifying** the identity of a **transaction** party. Hence burdens imposed upon consumers or other transaction parties are decreased.

DESCRIPTION OF DRAWING(S) - The figure shows the business transaction establishment system.

Abstract (Basic): US 20020077974 A1

NOVELTY - The data are read from a credit card using a credit card reader that is integrated with a wireless hand held device. A user inputs an electronic signature through a touch screen integrated with the hand held device, to authorize a transaction corresponding to the credit card .

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Credit card data processing system; and
- (2) Wireless hand held device.

USE - For electronic hand held devices such as personal digital assistant (PDA), wireless telephone, pager, mobile storage and computing device, desktop personal computer, WAP-enabled mobile phone, electronic tablet.

ADVANTAGE - Conducts economic transactions using hand held devices effectively. Enables wireless economic transactions very efficiently. Enables wireless point of sale. Permits the credit card holders to input electronic signature associated with credit card transactions. Enables transfer of electronic receipt to user's e-mail account associated with the credit card . Enables user to use the credit card any time using the mobile telephone.

DESCRIPTION OF DRAWING(S) - The figure shows a flowchart of operations for processing credit card transaction through the wireless hand held device.

US 20020082986	A1	10	G06F-017/60	

Abstract (Basic): US 20020082986 A1

NOVELTY - A customer code and a transaction code are provided to customer and a merchant code is provided to merchant by financial institution. The customer code and merchant code are received by financial institution through mobile telephone, when the **transaction** is to be provided. An **authorization** code is provided to merchant for transaction to the customer, after the reception of transaction code from customer.

USE - For making payment in e-commerce through mobile telephone or PDA .

ADVANTAGE - The burden of loss of money either to customer or to the merchant is prevented by providing transaction based on customer code and merchant code. Performs card-free transaction by wireless transmission. By using separate secure codes, the fear of codes being copied is prevented and hence the customer's right is secured. The merchant is prevented from receiving forged card or signature. Hence, provides safe, advanced and convenient payment mechanism for both the customer and the merchant.

DESCRIPTION OF DRAWING(S) - The figure shows a schematic view of the payment mechanism in the transaction **identification** center.

Abstract (Basic): AU 200161882 A

NOVELTY - An authentication **authorization** for the **transaction** is obtained directly from the issuer of the smart card (200) through the consumer device and verified. The **authorization** information is

added to the **payment** message corresponding to the transaction and sent from the consumer device to the merchant (225).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) System for enabling use of smart cards by consumer devices;
- (b) Method for enabling use of smart cards by consumer devices;
- (c) Method for using smart cards to perform trusted transaction

USE - For enabling usage of smart cards by consumer devices such as personal computer (PC), set-top boxes used for cable or satellite television access, video phones, cellular phones and **personal digital assistant (PDA)** in networking environment for internet commerce.

ADVANTAGE - Reduces the exposure of the consumer's account **number** which reduces the potential for theft by unscrupulous employees working at the merchant location by sending the **authorization** information along with the **payment** message to the merchant. The **authorization** simplifies the **payment** protocol and permits much of the consumer function to be operated remotely by the issuing bank. Increases efficiency of **authorizing** smart card **transactions** for internet on-line shopping by directly connecting the consumers to the smart card issuer.

DESCRIPTION OF DRAWING(S) - The figure shows the integration of EMV and 4-party protocol environment.

AU 200176651 A H04L-009/32 Based on patent WO 200219614

Abstract (Basic): WO 200219614 A1

NOVELTY - Method consists in prompting the user to enter a transaction **ID number** , entering the authentication code on a mobile phone and contacting the user via a **cell phone** , land phone or pager.

DETAILED DESCRIPTION - There is an INDEPENDENT CLAIM for a method of registering a user for secure e-commerce **transactions** , (2) a system for **authorizing** and authenticating e-commerce **transactions** .

USE - Method is for authenticating e-commerce transactions.

ADVANTAGE - Method increases transaction security.

DESCRIPTION OF DRAWING(S) - The figure shows a computing system for the authentication method.

AU 200070486 A G06F-017/60 Based on patent WO 200217181

Abstract (Basic): WO 200217181 A1

NOVELTY - Method consists in the payer transmitting details of the payment and an identifier to an Internet server, the server transmitting the payer and payee identifiers and payment amount to an authentication agency. The agency creates an authentication code and transmits it to the communications device (mobile phone, **PDA** etc.) for the payer, who transmits it back to the agency with a secret **ID** code for verification of the codes and **authorization** of the **payment**

DETAILED DESCRIPTION - There are INDEPENDENT CLAIMS for (1) a method of withdrawing cash from an ATM, (2) a system for authenticating electronic payments.

USE - Method is for e.g. making **credit card** payments over the Internet.

ADVANTAGE - Method is more secure.
DESCRIPTION OF DRAWING(S) - The figure shows a technical
architecture for the Internet payment method.

AU 200166628	A		G06F-017/60	Based on patent	WO 200193167
--------------	---	--	-------------	-----------------	--------------

Abstract (Basic): WO 200193167 A1

NOVELTY - Tokenless biometric **authorization** of an electronic
transaction between a consumer (7) and a merchant (1) uses an
electronic identicator and an access device (6). A consumer registers
with the identicator a registration biometric sample taken from the
consumer. The consumer and merchant establish mutual communications (5)
via the access device.

DETAILED DESCRIPTION - The merchant proposes a commercial
transaction to the consumer via the access device. The access device
communicates to the merchant an **identification** code associated with
the access device. After the consumer and merchant have agreed on the
transaction, the consumer and the identicator use the access device to
establish mutual communications. The access device communicates to the
identicator the **identification** code associated with the access
device. The identicator compares a bid biometric sample from the
consumer with registered biometric sample to try to identify the
consumer. Upon successful **identification**, the identicator

electronically forwards information regarding the consumer to the merchant. INDEPENDENT CLAIM is also included for the following: system for tokenless biometric authorization

USE - For wired telephones, cellular telephones, PDAs etc.

ADVANTAGE - Because each **transaction** is **authorized** using a biometric received from the consumer's person, the transaction cannot be repudiated, eliminating chargebacks. The invention is convenient for the consumer, in that the third-party identifier handles all financial account information, eliminating the need to recite or otherwise enter **credit card** or other account **numbers** into a telephone or **PDA**. The use of biometrics and encryption provides security, eliminating the possibility of fraud via intercepting transmissions from the telephone or **PDA**. The system supports the use of multiple types of financial accounts, providing flexibility for the consumer. Through its superior security and non-repudiation capabilities, the invention justifies a reduced discount rate for the merchant. By using ordinary telephone connections or existing wireless connections, the invention is easy to integrate with existing merchant computer, information, and payment systems. The invention does not require the consumer to use or possess any portable, man-made tokens containing data personalized to the user in order to complete a financial transaction.

DESCRIPTION OF DRAWING(S) - The diagram shows the overall collection of elements comprising the system.

----------------	----	--	--	-------------	--

Abstract (Basic): GB 2360860 A

NOVELTY - The network comprises web interface device, web site and communication device. The web interface device and web site enable a user to arrange an on-line agreement for goods purchased and communication device enables user to **authorize a payment** corresponding to the agreement.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) Communication device;
- (b) Web site;

- (c) Web interface;
- (d) On-line sale method;
- (e) Payment method for on-line transactions

USE - For facilitating on-line transaction and shopping using communication devices e.g. automatic teller machine, digital mobile telephone, WAP enabled **personal digital assistants**, telephone.

ADVANTAGE - As the payment of on-line purchased goods are authorized, the unauthorized use of financial account of user is prevented without disclosing **credit card** or financial account information relating the user to the merchant and hence providing an efficient on-line shopping.

DESCRIPTION OF DRAWING(S) - The figure shows the flowchart explaining the goods selling method.

Abstract (Basic): WO 200203177 A2

NOVELTY - A direct communication link is provided between a **cell phone** (15) and a local computer (11). A reference **number** stored in the **cell phone**, is read and compared with the reference **number** stored in a computer, for verifying the identity of a user.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) Access controlled computer;
- (b) Local computer;
- (c) Adapter;
- (d) Controller;
- (e) Access controlled digital system;
- (f) Credit account **payment approving** method

USE - For verification of identity of user seeking access to computer system including desk top computer, server, workstation, laptop computer, digital processing device and also to TV, domestic or industrial appliance, vending apparatus, cash register in financial, medical or government institutions using **cell phone**, **PDA**, pager, radio device, etc., through network e.g. internet, LAN, WAN.

ADVANTAGE - Digital accessing to computer is enabled in a secure manner by authenticating user **ID** reliably.

DESCRIPTION OF DRAWING(S) - The figure shows the block diagram of user authentication system.

KR 2001079056	A	1	G06F-017/60	

Abstract (Basic): KR 2001079056 A

NOVELTY - A method for **approving credit card transaction** using a bidirectional text message of the wireless Internet is provided to prevent a **credit card** from piracy, by making the **credit card** transaction checked via a mobile communication terminal of a **credit card** owner in response to an **identification** request of a **credit card** company.

DETAILED DESCRIPTION - A **credit card** member registers a **cellular phone number** for receiving a text message in a server of a **credit card** company(S210). The **credit card** member suggests a **credit card**, and then requests an approval of the **credit card** to an **approval relay company server** in **transaction** (S220). The **approval relay company server** requests a **transaction approval** to a **credit card** company, and the **credit card** company sends an **identification** message of the **transaction approval** request(S230). The **credit card** member inputs a secret **number** into a server of the **credit card** company in order to confirm the transaction(S240). The **credit card** company server checks the secret **number** from the

credit card member, and sends resultant data of the transaction approval request to the approval relay company server(S250).

KR 2001078847 A 1 G06F-017/60

Abstract (Basic): KR 2001078847 A
NOVELTY - A method for offering a payment service on a PDA (Personal Digital Assistant) using accumulated money is provided to improve a use degree of the accumulated money and the PDA, by supplying a coupon and a bar code to the PDA, and enabling payment of a product and service using the coupon and the bar code.
DETAILED DESCRIPTION - The coupon and the bar code are displayed on the PDA (S500). A clear button on the PDA is clicked so that validity of the coupon and the bar code can be checked(S501). When the clear button is clicked, the PDA is connected to a web server automatically(S502). The web server determines whether the coupon and the bar code are valid(S503). If the coupon and the bar code are not valid(S504), this information is sent to the PDA (S505). If the coupon and the bar code are valid and thereby the payment of the product is made, a code number database is updated(S506). A payment money database of an allied company is also updated(S507). A used coupon is deleted from the PDA automatically after the payment(S508).

Designated States (Regional): AL AT BE CH CY DE DK ES FI FR GB GR IE IT
LI LT LU LV MC MK NL PT RO SE SI TR

Abstract (Basic): US 20010044777 A1

NOVELTY - The self-service terminal has communication port for interfacing with a user's portable electronic device and for receiving a **transaction authorization** from the user's portable electronic device. A processor receives the requested transaction from the user's portable electronic device and processes the requested **transaction** without the terminal preparing an **authorization** request.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (a) the ATM;
- (b) the portable electronic device;
- (c) the transaction system;
- (d) the authorization request facility for execution on the portable electronic device;
- (e) and the public access docking terminal for the portable electronic device.

USE - Used as e.g. automated teller machine.

ADVANTAGE - Does not require any telecommunications links because self-service terminal does not obtain authorization from any device out with itself. Does not require any user interface, e.g. screen, encrypting **PIN** keypad, since all information is sent from and to portable electronic device. Does not need to access any network as **portable device** obtains authorization itself. Inexpensive and can be located anywhere provided an electronic device can establish a communication there. Enables users to typically **authorize transaction** when in the vicinity of the terminal, thereby avoiding problem of user carrying a pre-**authorized transaction** on his/her portable electronic device. Ensures reduced possibility of fraud or replay attacks. Ensures reduced cost in owning and maintaining an ATM. Ensures simple user interface on terminal because user enters a transaction on his/her own user interface. Ensures no telecommunication costs associated with each transaction.

DESCRIPTION OF DRAWING(S) - The figure is a flowchart showing the steps involved in obtaining a **transaction authorization**.

Abstract (Basic): WO 200163375 A2

NOVELTY - System comprises an administrating server (3) communicating with mobile phones (1), and communication units at the merchant points of sale (2) identifying the mobile phone and sending a message to the server identifying merchant, customer and amount to be paid. The server then sends the transaction details to the mobile phone for authorization by the customer, receives them back, sends a **transaction authorization** to the communication unit and this sends a message to the server which then debits the customer account.

DETAILED DESCRIPTION - The network is GSM, the phone uses a hardware or software application program stored in memory or SIM card, communication is by using SMS or WAP protocol, **ID numbers** are used for **identification** and can be arbitrary codes or **numbers** and the server and communication unit communicate through a point-to-point line, telephone line, wireless link or the Internet. Messages can be voice authorization requests. There is an INDEPENDENT CLAIM for a method of conducting transactions over a mobile phone network.

USE - System is for financial transactions using mobile phones.

ADVANTAGE - System uses mobile phones as terminals, minimizes the **number** of messages transmitted between the customer, merchant and the network server, centralizes accounts administration and stores the system user application on a SIM card for rapid installation in any **cellular phone** operating with a SIM card.

DESCRIPTION OF DRAWING(S) - The figure shows a mobile transaction system with

mobile phone (1)
point of sale (2)
administrating server (3)

Abstract (Basic): KR 2001000363 A

NOVELTY - A real time payment method is provided to perform safely a payment on a transaction between one person and the other person or a company by using mobile communication terminals and short message service, and to prevent a leakage of the personal information in the conventional payment method.

DETAILED DESCRIPTION - A real time payment method comprises steps of a user performing a payment log-in by a **password** registered at a member subscription(1), selecting a payment execution by inputting a payee data, a payment amount and a **password** (2), transmitting the input data to a payment server(3), and displaying a payment check short message on an LCD of the **cellular phone**. If the user **approves** the transmitted short message, the **payment approval** message is transmitted to banks or financial organizations and an automatic fund transfer is performed between the payer and the payee.

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes
FR 2798486 A1 5 G06F-015/02

Abstract (Basic): FR 2798486 A1

NOVELTY - The device organizes categories of natures of expenses described in terms of national and convertible currencies including euros. Several touch control keys are used for e.g. forecasting monthly outgoings key (12), real outgoings evaluation (13), a **transaction validation** key (16), **transaction** canceling key (17), Euro data entry setting key (19) and a national currency data entry setting key (20).

USE - As an electronic device of **credit card** format to manage from e.g. daily expenses of a user or an enterprise compared with a budget in value and in time.

ADVANTAGE - Provides of the categories in estimated value and in real budget. Provides report of the expenses comparative to the budget by category and in total for a month or every month of the year, report of the state of the expenses in past in national currency or in Euros.

DESCRIPTION OF DRAWING(S) - The drawing shows a layout of the financial organizer according to the present invention.

monthly outgoings key (12)

real outgoings evaluation (13)

currency selection key (14)

transaction validation key (16)

Euro data entry setting key (19)

national currency data entry setting key (20)

Abstract (Basic): WO 200052866 A2

NOVELTY - An emulation card has emulation card interface which emulates interface of electronic smart card, facilitating communication between card and **charge card** terminal. A memory stores card data pertaining to primary card of user. A portable emulation card configuring device writes card data from memory to emulation card if user is authenticated through authentication mechanism.

DETAILED DESCRIPTION - The emulation card appears through emulation card interface after writing. The **charge card** terminal is an automatic teller machine or point of scale terminal.

INDEPENDENT CLAIMS are also included for the following:

(a) **charge card** transaction permitting method;
(b) user permitting method to **approve** Internet **transaction** request

USE - For permitting user to conduct smart card transaction in electronic **transaction** system using **portable electronic authorization device**.

ADVANTAGE - The **identification** data related to the user is kept secure within **PEAD** at all times and **transaction approval** occurs within **PEAD** and data representing such approval is encrypted. Even if approval data is intercepted, its encryption prevent unauthorized users from employing the **identification** data for illicit purposes.

DESCRIPTION OF DRAWING(S) - The figure shows the portable electric **authorization device** for securely **approving transactions** conducted by electronic **transaction** system.

Abstract (Basic): WO 200000928 A1

NOVELTY - The pen input device traces image on a writing surface, and a sensor detects movement of nib on pen and generates corresponding data signal. A transmitter transmits the signal to receiver of a wireless communication device which transmits the signal over a communication channel.

DETAILED DESCRIPTION - The transmitter comprising a serial data generated is either an IR transmitter or RF transmitter. The data signal is formatted to data packet confirming to a data transfer protocol, by a data packet generator. The wireless communication device is either a mobile telephone, PDA with wireless communication device or a wireless modems.

An INDEPENDENT CLAIM is also included for method for verifying identity of a user at remote location.

USE - For pen input device of laptop computer for verification of signature for credit card purchase, white-board application, chat application, web-based application, web-page, E-mail applications.

ADVANTAGE - Enables verification and analysis of user's signature or other image data at remote server, thereby enabling utilization of image transmitting system for authorizing financial transaction.

DESCRIPTION OF DRAWING(S) - The figure shows the functional block diagram of system which permits user to transmit voice and data over a wireless network.

Abstract (Basic): US 5991749 A

NOVELTY - A service provider's CPU processes account and authorization-information, in response to function code entered by user on keypad of cellular phase. The service provider CPU, identifies desired transaction and supplies personal ID number if needed. The desired transaction is authorized to determine different accounts involved and confirms completion of transaction.

DETAILED DESCRIPTION - The desired transaction involves a default amount at preset price and variable amount. An INDEPENDENT CLAIM is also included for a method for verifying identity and authorizing access to secured location.

USE - For collecting tolls of cellular telephones, electronic wallet, wireless PIN pad, contactless smart card, etc.

ADVANTAGE - Highly reliable and simple technique provides desirable results since an unauthorized user with closed cellular phone would need to know unique function code, account number and personal identification number (PIN) to complete the transaction and generate a confirmation number and thus transactions of unauthorized users are not performed.

DESCRIPTION OF DRAWING(S) - The figure shows the chart of the steps involved in computer tolling procedure.

US 5615110	A		13		

Abstract (Basic): TW 250553 A

The system transmits a 'transaction occurring' message combined with a checking **password** address of the actual card owner. It is transmitted via the corresponding computer accepting system of the bank or phone company. The signal is transmitted to the transaction signal transmitting station by radio signal, the public phone line or communication cable.

The station transmits a 'received transaction' message by a preset encoding signal. The receiver is checked out with the **password** address. The corresponding message including the transaction amount and location is received. It is displayed on screen to judge if the transaction is legal or illegal. When the above transaction is illegal, the corresponding computer accounting system is notified to stop the transaction process through the communication tools.

USE/ADVANTAGE - Prevents illegal use of stolen **credit card** or **cellular phone**.

Abstract (Basic): WO 9306564 A

The portable unit (10) has a housing (20) with top, bottom and two end surfaces, and a magnetic reader unit (40) for reading **credit card** information carried within the housing adjacent to the first end of the housing. A data entry portion is used for entering customer information, and a scanner scans the product **identification** information, the scanner position adjacent to the second end of the housing.

A display (80) displays selected **credit card** information, customer information and product **identification** information, and is located by the top surface of the housing. A printer (90) prints a customer receipt. A communications unit (110) furnishes **transaction approval**. A processor receives the **credit card** information, the customer information and the product **identification** information and controls the display, the printer and the approval furnisher.

ADVANTAGE - Provides portable, hand-held data collection terminal, including all necessary functions to facilitate and complete point of sale **credit card** transaction.

Abstract (Basic): EP 379333 A

At least one portable electronic device communicates with at least one terminal device. The **portable device** (4) verifies that the terminal device (3) is a valid one. The terminal device verifies that the **portable device** is valid. Further verification is performed to ensure that the user is authorised to use the system. A protection device prevents tampering with a terminal, and decodes data at the interface between the **portable device** and the terminal device. ADVANTAGE - The system provides security against unauthorised access. The invention has use in the fields of automatic banking, automatic credit and debit **transactions**, passport and travel visa **verification**, health and medical records, security access, licensing and any other like field where fraud may pose a problem.

Abstract (Basic): WO 8203484 A

The device is carried by the user and includes, in a housing a battery-operated microprocessor, a keyboard for entering **identification** and transaction data, and a display. For offline use, a voucher is received in an end recess of the housing and is printed by a print head mounted beneath a pivotable bar.

In use on-line, the device is placed in a cradle at the transaction station and the personal identity **number** is entered on the keyboard. Instructions are passed from the keyboard to an interactive terminal which provides communication between optical transceivers over the optical data link. This allows authorisation to be obtained directly from the authorising institution which returns data to the display at the **transaction** station and on the **verification** device.

Abstract (Basic): US 6594759 B1

pub? 1/25/02 ?

NOVELTY - The device has a central processing unit and an electronic authorization firmware embedded on motherboard or on a plug-in board. The firmware has a memory circuit and an encryption logic circuit. The memory circuit stores a user private key (304) and user identification data (302) and the encryption logic circuit **approves a transaction request** by encrypting it using the private key.

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for a method of configuring electronic authorization firmware.

USE - Used for electronic transactions conducted through computer networks, automated teller machines (ATMs), automated point-of-sale systems, automated library and systems.

ADVANTAGE - The embedded electronic **authorization** firmware provides **transaction approval** within the system and eliminates the need to have the identification data and the users private key in the requesting device, and also enhances the confidentiality of the user identification data and the users private key. The device is also portable.

DESCRIPTION OF DRAWING(S) - The drawing shows a portable electronic authorization device.

Encryption logic circuit (300)

User identification data (302)

User private key. (304)

Abstract (Basic): US 20030004827 A1

NOVELTY - The use of a merchant card at a central processing area is detected. A phone number or a pin number to cause a call to be placed to a cellular phone of a user to **authorize** the charge card **transaction**, is utilized based on detection result. A report of the user charge card transaction is transmitted to the cellular phone and **approval** of the **transaction** to a merchant's charge card terminal is authorized.

USE - For permitting user to conductor charged card transaction using ATM, point of sale system, etc.

ADVANTAGE - The confidentiality of the user identification data and user private key are enhanced, thus integrity of **transaction approval** process is improved.

Abstract (Basic): US 20020123967 A1

NOVELTY - A share secret is searched from a share secret table in a portable electronic authorization device (PEAD) (200). Received digital data representing a secure message, is decrypted, if the share secret is found otherwise a share secret is computed in the PEAD.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) Internet-based secure message transmission method; and
- (2) Internet-based secure message exchanging method.

USE - For receiving a secure message pertaining to an electronic transaction conducted over Internet.

ADVANTAGE - Allows transaction approvals to occur within the portable electronic authorization device (PEAD), hence enhances the confidentiality of the user identification data and the user's private key and enhances the integrity of the transaction process.

DESCRIPTION OF DRAWING(S) - The figure shows a portable electronic authorization device.

Abstract (Basic): US 20020023215 A1

NOVELTY - The portable electronic **authorization device** (PEAD) (200) receives the **transaction request** in the form of digital data. If the **transaction request** is **approved** by a user of the PEAD, the private key of the specific user is decrypted using the decryption key of a remote server. The decrypted digital data is transmitted to the electronic transaction system for encryption by the user private key.

USE - For electronic transactions through computer networks like Internet, automated teller machines, automated point-of-sale systems and automated library systems.

ADVANTAGE - Eliminates risk of unauthorized access to the account of the user and unauthorized procurement of user identity. Is portable and permits user to perform transaction authentication, conveniently and comfortably.

DESCRIPTION OF DRAWING(S) - The figure shows the PEAD for securely **approving transactions** conducted by electronic **transaction system**.

Abstract (Basic): US 6175922 B1

NOVELTY - The method involves receiving digital data, representing
a transaction request, from a PEAD (200). A user is then provided with
information regarding an ability to **approve** the **transaction**
request. When the **transaction** request is **approved** by the user, the
PEAD receives another digital data representing the electronic service
authorization token.

DETAILED DESCRIPTION - The electronic service authorization token
is used to **approve** the **transaction** request between the electronic
transaction system (102) and PEAD. INDEPENDENT CLAIMS are also included

for the following:

- (a) the PEAD;
- (b) and the service rendering method between electronic transaction system and PEAD.

USE - For conducting electronic transactions between electronic transaction system and PEAD.

ADVANTAGE - Eliminates security risks associated with conventional approval of transactions between user and electronic transaction system. Completes a transaction request pertaining to an electronic transaction conducted over an electronic network with server and requesting device. Transmits encrypted transaction approval data to server to complete electronic transaction. Enhances confidentiality and security of data items. Uses PEAD of reduced size, weight and cost.

DESCRIPTION OF DRAWING(S) - The figure shows the PEAD for securely approving transactions conducted with an electronic transaction system.

Electronic transaction system (102)

PEAD (200)

US 6282656 B1 H04N-001/413 Cont of application US 96759555
Cont of patent US 5917913

Abstract (Basic): WO 9825371 A

The **transaction authorisation** method involves using a hand-held personal electronic authorisation unit. When the user requires to **authorise a transaction**, e.g. a request at an automated teller machine (ATM) (202), the ATM transmits the transaction detail via a port (204). This can be a radio, infrared or physical port.

The hand-held unit (200) receives the transaction data and either it or the ATM displays the data to the user for authorisation. The user can then press a switch (210) to provide authorisation. The unit transmits the relevant user security codes in an encrypted format. The hand-held unit can include a system to verify its use by its true owner.

ADVANTAGE - Improves authorisation security by avoiding visibility of passwords and using encryption.

Detailed Description
Claims

Detailed Description

... With reference to Fig. 2, requesting device 202 may initiate a transaction approval process with **PEAD** 200 by transmitting to **PEAD** 200, via communication port 204, a transaction request pertaining to a proposed transaction. Requesting device...

...a certain amount of money. The transaction request itself may include, for example, the transaction **ID**, the merchant's name, the merchant's **ID**, the time of the proposed purchase, and the like. In one embodiment, the transaction request...

...for enhanced security but this is not required. Data pertaining to the proposed transaction reaches **PEAD** 200 via path 206 in Fig. 2.

Port 204 may represent an infrared port to...

...the user may then signify his approval by activating a switch 210 on **PEAD** 200, which causes an approval message to be created with the user's **identification** data, encrypted and transmitted back to requesting device 202 via path 212. If the **transaction** is not **approved**, the user may simply do nothing and let the transaction request times out after an elapsed time or may activate another switch on **PEAD** 200 (not shown in Fig. 1), which causes a reject message, either encrypted or nonencrypted...

...present invention employs the circuitries within the portable electronic authorization device (**PEAD**) to perform the **approval** and encryption of the **transaction approval** data within the **PEAD** itself. In contrast, prior art data cards are essentially passive devices. For example, prior art...

...magnetic stripe for storing account information and do not have any facility to perform **approval** and/or encryption of the **transaction approval** data. While smart cards or IC cards, which are currently being developed, may contain electronic...

...their implementation still requires a reader associated with the requesting device to read out the **identification** data and/or user's private key in order for the requesting device to perform...transaction approvals to occur within **PEAD** 200. The fact that transaction approvals occur entirely within **PEAD** 200 provides many advantages. By way of example, this feature eliminates the need to have, in one embodiment, the **identification** data and/or the user's private key in the requesting device. The fact that **transaction approvals** occur entirely within **PEAD** 200 (using the user **identification** data and/or the user's private encryption key that are always kept secure within **PEAD** 200) substantially enhances the confidentiality of the user **identification** data and the user's private key, as well as the integrity of the **transaction approval** process.

Since approval occurs entirely within **PEAD** 200, the user **identification** data that is employed to authenticate transactions may be more complicated and elaborate to ensure greater security. By way of example, the user **identification** data may be more elaborate than a simple **password** and may include any of the user's name, his birth date, his social security **number**, or other unique biometrics or unique identifying data such as fingerprint, DNA coding sequence, voice print, or the like. In contrast, prior art authentication techniques limit the user **identification** data to simple patterns, e.g., simple **password** of few characters, that are easily memorized by the user since more
